

EXECUTIVE ONE-PAGER

End-to-End Forwarding in Business Central

A Business Central-native TMS for freight forwarders, brokers, 3PL teams, and logistics service providers that need one connected process for customer jobs, carrier execution, settlement, and invoicing.

Built for LSP teams that need to:

- Capture customer forwarding requests
- Split complex moves into stages
- Assign carrier execution per leg
- Control cost, revenue, and margin
- Invoice directly from the transportation job

How the LSP workflow connects

Forwarding Order

Defines what must move, who ordered it, cargo, origin and destination parties, dates, stages, services, costs, and settlement.

Freight Order

Defines how transportation is executed: carrier, pay-to vendor, driver, vehicle, route, charges, documents, and stage entries.

Settlement

Connects income, supplier costs, cost allocation, invoice creation, expected profit, and uninviced-work control.

Run the full LSP transportation lifecycle — from customer request to carrier execution, financial reconciliation, and posted history — without leaving Business Central.
