

Business Central-native transportation management for shippers

Plan truck loads, drivers, routes, carrier options, dispatch documents, freight costs, and execution history from the same ERP workflow.

For manufacturers, distributors & retailers

Own fleet • hired carriers • mixed operations

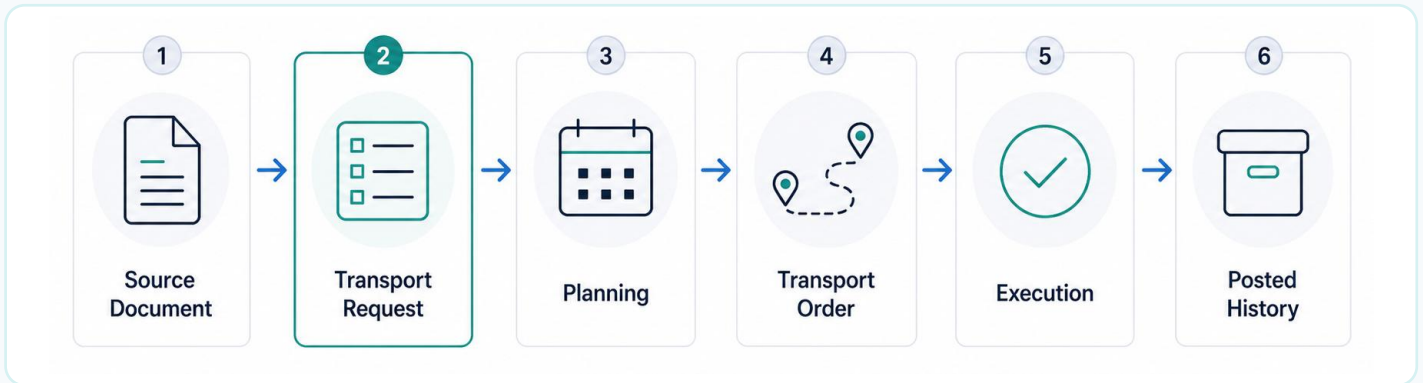

Candidate fit, load %, warnings, and blockers before dispatch

CORE IDEA

Turn open Business Central demand into feasible, dispatch-ready transportation — without a separate TMS.

Shipper TMS connects source documents, load planning, route control, resource assignment, freight cost allocation, warehouse work, proof of delivery, and posted transport history in one native Business Central workflow.

End-to-end planning-to-execution flow

What planners and operations teams get

A single transportation operating model built on Business Central documents, master data, posting logic, and APIs.

- 1

Native demand capture

Create Transport Requests from sales, purchase, transfer, return, and warehouse documents with line-level quantities, addresses, and delivery rules.
- 2

Planning views that fit the day

Plan by open request, truck slot, driver slot, or visual timeline using Load Management, Truck Load Management, Driver Load Management, and Visual Scheduler.
- 3

Feasible loads before release

Check weight, volume, floor space, logistic units, compartments, driver and vehicle availability, route, zone, time slot, and transport condition rules.
- 4

Execution-ready Transport Orders

Control route stops, stop sequence, loading order, carrier, vehicle, driver, reports, warehouse documents, operational status, and posting.
- 5

Carrier and freight cost control

Compare carrier options, create transport charge lines, and allocate freight costs to source orders by distance, weight, volume, units, or custom rules.
- 6

Scalable execution visibility

Extend with Logistic Units, WMS flows, Proof of Delivery, execution entries, attachments, posted history, telematics, and Business Central API pages.

BUSINESS OUTCOMES

Fewer dispatch surprises · No duplicate TMS entry · True delivery cost by order · Scales into PoD, WMS, telematics & APIs
